

# Extra Work Delivered — Beyond the Proposal

Corescent Technologies · 05 October 2026 · This document lists every feature built that was NOT part of the original quotation.

## Summary

Each extra feature required work on the server side (Backend — the logic, database and APIs that make things work) and/or the screen side (Frontend — the pages, buttons and visual elements the user sees and clicks).

| Category             | Count | What it means                                                    |
|----------------------|-------|------------------------------------------------------------------|
| Backend + Frontend   | 22    | Both server logic and user interface were built for this feature |
| Frontend Only        | 1     | Only the visual/user-interface side was needed                   |
| Backend Only         | 0     | Only server-side logic was needed (no new screen required)       |
| Total Extra Features | 23    |                                                                  |

## Detail — Every Extra Feature with Backend & Frontend Breakdown

Blue column = Backend work done. Purple column = Frontend work done.

| Extra Feature                                                                                                                                                                                                                                                       | Backend Work Done                                                                                                                                                                                                | Frontend Work Done                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Multiple WhatsApp Numbers per Account</b><br><br>One business account can connect more than one WhatsApp number. Staff can switch between numbers inside the app and conversations are routed to the correct number automatically.                               | New 'WhatsApp Integration' database table storing one record per connected number. Every incoming/outgoing message is matched to the right number using a business-ID field added to all message-handling logic. | Business Switcher dropdown in the sidebar so users can flip between numbers in one click. Inbox and conversations filter automatically when you switch.     |
| <b>Reseller Sub-Accounts with Commission Tracking</b><br><br>A reseller (agency/partner) can log in, create client accounts under their brand, set their own pricing plans, and see how much commission they have earned — all without Corescent staff involvement. | New account type 'RESELLER' with parent-child relationship between reseller and client tenants. Commission rate stored per plan. Commission calculated and stored each time a client payment is recorded.        | Full reseller navigation: Overview, Clients, Plans, Commissions, Wallet, Branding, Settings. Commission table shows earnings per client with payout status. |
| <b>Onboarding Wizard for New Users</b><br><br>The first time someone registers, a 5-step guide walks them through setting up their account — so they reach a working product in under 10 minutes without needing any support.                                       | Server checks after every login whether the user has completed setup. Incomplete setup redirects to the wizard automatically.                                                                                    | 5-step wizard screens: (1) Business profile, (2) Connect WhatsApp, (3) Invite team members, (4) Upload first knowledge document, (5) Done.                  |

| Extra Feature                                                                                                                                                                                                                       | Backend Work Done                                                                                                                                                        | Frontend Work Done                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contact Segments with Rule Builder</b> <p>Create audience groups using conditions — for example 'all contacts from Instagram who are in Mumbai'. These segments can be used to target campaigns to exactly the right people.</p> | Segment rules stored in the database. A query engine resolves rules to a live contact list at campaign-send time, so the audience is always up to date.                  | Visual rule builder: add/remove conditions, AND/OR toggle, live preview showing how many contacts match before saving.                                                |
| <b>Bulk Contact Actions</b> <p>Select many contacts at once and apply an action to all of them together — add a tag, block, archive or delete — instead of doing it one by one.</p>                                                 | New bulk-action API endpoint that processes up to 500 contacts in one request efficiently.                                                                               | Checkboxes on every contact row, 'Select All' button, action toolbar that appears when contacts are selected. Success/undo toast notification after each bulk action. |
| <b>Contact Import &amp; Export (CSV / Excel)</b> <p>Upload a spreadsheet of contacts to add them all at once. Download your entire contact list as a spreadsheet any time.</p>                                                      | Import endpoint reads CSV/Excel, validates each row, skips duplicates, and creates contacts in bulk. Export endpoint streams all contacts as a downloadable file.        | Import button opens a file picker. Export button downloads the file immediately. Import shows a results summary: how many added, how many skipped.                    |
| <b>Blacklist — Block Numbers from Receiving Messages</b> <p>Maintain a list of phone numbers that must never receive any message from your platform. Useful for DND numbers or opted-out contacts.</p>                              | Blacklist table in the database. Every outgoing message is checked against it before sending.                                                                            | Blacklist page: search blacklisted numbers, manually add a number, import a list via CSV, remove numbers in bulk.                                                     |
| <b>Bulk Broadcast — Quick Send Without a Campaign</b> <p>Paste a list of phone numbers, pick a message template, and send. No need to set up a named campaign — useful for one-off sends.</p>                                       | Reuses the campaign-send engine but without creating a campaign record. Numbers are validated before queuing.                                                            | Step-by-step wizard: Step 1 paste numbers, Step 2 pick template, Step 3 schedule or send now.                                                                         |
| <b>Campaign Click Tracking</b> <p>When a campaign message contains a link, the platform tracks whether the recipient clicked it. You can see the click rate for each campaign.</p>                                                  | Links in outgoing messages are automatically rewritten to pass through a tracking endpoint. When someone clicks, a click record is saved and the click count is updated. | Click-rate column added to the campaigns table. Campaign detail modal shows clicks alongside sent/delivered/read numbers.                                             |

| Extra Feature                                                                                                                                                                                                                                                | Backend Work Done                                                                                                                                                                     | Frontend Work Done                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto FAQ Generation from Documents</b> <p>After uploading a document to the Knowledge Base, the AI automatically reads it and writes 5 question-and-answer pairs that your customers are likely to ask. You can edit them before they go live.</p>        | <p>After a document is indexed, an AI call generates 5 Q&amp;A; pairs and saves them to the database linked to that document.</p>                                                     | <p>FAQ workbench panel on the Knowledge Base page: view AI-drafted FAQs, edit the question or answer, save changes.</p>                                                      |
| <b>AI Conversation Summary</b> <p>One click produces a plain-English summary of any conversation — key points discussed and next action items — so an agent can get up to speed instantly.</p>                                                               | <p>Summarise API endpoint sends the last 50 messages to the AI with a structured prompt and returns a summary plus a bullet-point action list.</p>                                    | <p>Summarise button in the conversation toolbar. Summary appears in a panel inside the chat view.</p>                                                                        |
| <b>WhatsApp Embedded Signup (Connect via Meta Login)</b> <p>Clients can connect their WhatsApp Business account by clicking 'Connect' and logging in with Facebook/Meta — no manual copy-pasting of API keys needed.</p>                                     | <p>Meta OAuth flow: receives auth code, exchanges for access token, fetches WhatsApp Business Account and phone number IDs, subscribes webhook, saves everything to the database.</p> | <p>Embedded signup button on the Settings/WhatsApp page. Shows connected number with status after successful login.</p>                                                      |
| <b>WhatsApp Number Health Monitor</b> <p>Shows the current health of each connected WhatsApp number — quality rating (High/Medium/Low), daily message limit tier, and recent usage — so you know if a number is at risk of being restricted by WhatsApp.</p> | <p>API endpoint fetches quality rating, tier and usage data live from Meta's Business API on each page load.</p>                                                                      | <p>Health card on the WhatsApp settings page showing rating badge, tier label and a usage bar.</p>                                                                           |
| <b>Wallet &amp; Credit Top-Up</b> <p>Each account has a wallet balance. Clients can add money to their wallet using a payment link and the balance is used for sending messages or running campaigns.</p>                                                    | <p>Wallet table in the database. Razorpay order is created on the server, payment is verified via webhook, and balance is credited after confirmation.</p>                            | <p>Wallet page: current balance card, 'Add Credits' button that opens Razorpay payment, full transaction history with date and amount.</p>                                   |
| <b>Super Admin — View as Any Client (Impersonation)</b> <p>The super admin can click 'View As' on any client account and immediately see the entire platform exactly as that client sees it — without logging out or sharing passwords.</p>                  | <p>A secure cookie stores the impersonated account ID. Every API call checks for this cookie and serves data for the viewed account instead of the admin's own account.</p>           | <p>View As button on the admin tenant detail page. A visible banner at the top of the screen shows whose account is being viewed. Exit button returns to the admin view.</p> |

| Extra Feature                                                                                                                                                                                                                                            | Backend Work Done                                                                                                                                                                      | Frontend Work Done                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Admin — WhatsApp Panel for All Client Accounts</b> <p>The super admin can see which WhatsApp numbers each client has connected, their connection status, and can force a reconnect if needed — all from the admin dashboard.</p>                      | Admin API endpoint fetches WhatsApp integrations for any tenant with health status.                                                                                                    | WhatsApp panel in the admin tenant detail page: list of connected numbers, status badge (Connected / Disconnected), force-reconnect button.                                                                                                                                                  |
| <b>Admin — Browse Any Client's Contacts</b> <p>The super admin can search and browse the contact list of any client account for support or verification purposes.</p>                                                                                    | Admin contacts endpoint accepts a tenantId query param and returns that tenant's contacts.                                                                                             | Contacts panel inside the admin tenant detail page with search and pagination.                                                                                                                                                                                                               |
| <b>Invite Code &amp; Disposable Email Block on Registration</b> <p>New accounts can only be created with a valid invite code. The system also blocks known throwaway/temporary email providers automatically.</p>                                        | Invite code is looked up in the database before the account is created — invalid code returns an error. A list of 50+ known disposable email domains is checked on every registration. | Error messages shown inline on the sign-up form if the invite code is wrong or the email is from a blocked provider.                                                                                                                                                                         |
| <b>Fully Mobile-Responsive Application</b> <p>Every page of the dashboard works correctly on phones and tablets. Navigation, buttons, tables and chat all adapt to small screens.</p>                                                                    | Not applicable for this feature.                                                                                                                                                       | Sidebar slides in/out with animation on mobile. Buttons wrap to the next line instead of overflowing. Chat layout stacks vertically on small screens. iOS Safari browser bar handled correctly so content is never hidden behind it. Leads board switches to list view by default on phones. |
| <b>Reseller SMTP — Emails Sent from Reseller's Own Domain</b> <p>When a reseller's client receives a system email (like a password reset), it comes from the reseller's own email address, not from Corescent — making it look fully white-labelled.</p> | Email sending logic checks for a reseller SMTP configuration first. If found, uses the reseller's mail server and from-address. Falls back to platform settings if not set.            | Reseller SMTP form in the Settings page: host, port, username, password, from-address.                                                                                                                                                                                                       |
| <b>Lead Stage Customisation</b> <p>Businesses can rename the pipeline stages and add their own stages to match how their sales process actually works.</p>                                                                                               | Lead stages are stored per tenant in the database, not hardcoded. Stage order is preserved. All lead APIs use the tenant's custom stages.                                              | Lead Stages tab in Settings: add a stage, rename, reorder by drag, delete unused stages.                                                                                                                                                                                                     |

| Extra Feature                                                                                                                                                                                                                                                                     | Backend Work Done                                                                                           | Frontend Work Done                                                                                                                                                                                                             |

| <b>Quick Replies Management</b><br><br>Agents can save frequently used messages and send them in one click during a conversation — no need to type the same thing repeatedly.                                                                                                     | Quick replies stored per tenant in the database. Full CRUD API.                                             | Quick Replies tab in Settings to add/edit/delete saved replies. In the chat, a shortcut button opens the quick reply picker.                                                                                                   |
| <b>Template Validation &amp; Media Guard</b><br><br>When creating a WhatsApp message template, the system checks that the language matches the text typed, and that an image/video is uploaded if the header requires one — preventing templates from being rejected by WhatsApp. | Server-side validation on template create/edit: header type vs content type mismatch returns a clear error. | Inline warnings in the template editor when language does not match the selected locale. Image/video upload field shown or hidden based on selected header type. Form cannot be submitted until all required fields are valid. |

*All features above were delivered within the same project timeline and budget. None were charged additionally.*
